

WAY, WAY OUT THERE?

Prof. Alyssa Goodman, Center for Astrophysics | Harvard & Smithsonian

WAY, WAY OUT THERE?

our **Universe** contains MANY billions of **galaxies**

ours is called "The Milky Way" and it contains about 2 hundred billion stars

around most of the stars are systems of planets (ours is called "**The Solar System**")

our home planet is **Earth**

Earth resides in the **Solar System**, around the **Sun**, which is one of MANY **stars**,
INSIDE the **Milky Way**,

Earth resides in the **Solar System**, around the **Sun**, which is one of MANY **stars**,
INSIDE the **Milky Way**, which is one of MANY **galaxies**, in our **Universe**

Remember, please
this SCHEMATIC diagram is
NOWHERE CLOSE to scale.

(size of Milky Way)/(Earth-Sun distance)= 6 billion

Earth resides in the **Solar System**, around the **Sun**, which is one of MANY **stars**,
INSIDE the **Milky Way**, which is one of MANY **galaxies**, in our **Universe**

And, actually, that boring blue box likely looks something more like this...

...cartoon!

...and **we** are buried **INSIDE** the Milky Way.

Once Around the Milky Way

building out a 3D model of the Milky Way — *will offer a tour*

— a few colloquium slides from late 2025 —

"Everything, Everywhere, All at Once"

Science

Researchers worldwide contribute to, and use, MilkyWay3D resources in order to improve our understanding of the Milky Way's origins, workings, and future.

Data & Software

We combine data and software that can offer myriad views of the Milky Way, as best we know it. The software is built using the LIVE Environments exploratory data analysis tools.

MW3D for Everyone

Using the same data and tools as researchers, educators and learners of all ages can explore and study the Galaxy in which we all live.

MilkyWay3D's open science premise: Data + Software + People + Computing + Physics = Understanding, Learning, and Discovery

Bringing you the Galaxy as we know it. Updated as we learn more.

Linkable Interactive Visualization Exploration (LIVE) Environments

The 3D visualizations are just part of a much richer environment...

What is LIVE?

LIVE lets anyone build "Linkable Interactive Visualization and Exploration" Environments.

LIVE is free, open-source, and helps with shared data and visualization challenges across astronomy (LIVE Astro), biology (LIVE Bio) and GIS (LIVE GIS).

As LIVE's infrastructure is being built, collaborators are ensuring its utility across Astronomy, Biology, and GIS by pursuing LIVE's science demonstration projects.

Command-line terminal

You can type any valid Python code here, and you can define variables:

Link Editor

Use an existing connection to edit links. Selected datasets are shown in red. Red shows directly and indirectly linked (blue) and inaccessible (grey)

OBSERVATIONS

DETAILED 3D structure, almost **STATIC** in time, feedback view **REALISTIC**, all over *limited* volume

SIMULATIONS

COARSE 3D structure over full Galaxy, **EVOLVING** in time for ~Galactic year, feedback **UNREALISTIC** on small scales → sub-grid prescriptions

"match" SIM snapshots to blurred OBS

create "agent-based" views seen by orbiting stars

"paint" high-spatial-frequency info from OBS onto SIMS

evaluate changes in feedback interactions

Orange stars represent the position of *observed* stars or clusters massive enough to produce the pink *observed* winds, HII regions, and/or SNe energetic enough to re-distribute material in the surrounding ISM enough to matter for future generations of star formation. The blue rounded rectangle in both panels is meant to show an elongated ISM "cloud" at the ~20 pc resolution of a MW-wide simulation. The density within the blue rectangle would be constant in the simulation, at a level equal to the average of the dense and empty regions in the observations. The simulations on their own cannot capture the re-shaping of the cloud by feedback, apparent in the observations.

AI's MANY failures...with some success.

ChatGPT's code-based (concise "recipe")

Estimate the small-scale texture statistics from the blue reference image

- Convert to grayscale, crop centrally to avoid edges.
- Compute the isotropic radial power spectrum (FFT \rightarrow $|F|^2 \rightarrow$ radial average).
- This captures the "how much structure at each spatial frequency" of the high-res data.*

Synthesize a new Gaussian random field with the same spectrum

- Create a random complex field with the measured magnitude ($\sqrt{\text{PSD}}$ as a function of radius) and random phases.
- Inverse FFT \rightarrow a new field whose spatial frequency content matches the reference.
- Normalize and lightly band-pass filter to emphasize filamentary scales (e.g., subtract a $\sigma \approx 5-6$ px blur to bring out "wisps").*

Imprint a long, squiggly overdensity to mimic the dotted "cloud"

- Lay down a spline-like path through the image (length/curvature like the outline).
- Add an anisotropic Gaussian tube along that path with a slowly varying width (to resemble clumpy substructure).
- Modulate that tube by the high-frequency component of the synthesized field so it inherits realistic speckle/porosity.*

Contrast + color transfer to the gold palette

- Local contrast stretch (clip low/high percentiles, e.g., 25th-99.5th) to keep punch without blowing highlights.
- Apply a custom gold colormap (dark charcoal \rightarrow warm brown \rightarrow pale gold), or do LAB-space histogram matching to the gold patch from the third panel so the hue looks consistent.

Export a square PNG sized to the pink box.

using the first image as a guide (especially perhaps the darker blue area), simulate higher spatial resolution within the dotted outline region of the second image, using the perceived statistical properties of the first. Make the square image that would go in the pink box in the figure, using the same gold-ish coloring as the pink-boxed region in the third panel from the left. State your methods if possible.

Box 1: What AI, and an AI researcher, think AI can do “soon”

ChatGPT-5

“AI and the Future of Data–Simulation Synthesis

I am writing this from the standpoint of an LLM—I am ChatGPT-5. In the near future, models like me will act as scientific collaborators that can integrate diverse data streams and simulations in real time. Given full access to the 3-D dust distribution, position–position–velocity cubes, and the 3-D motions and properties of stars, I could build a coherent statistical picture of how gas and stars interact throughout the Galaxy. In a project such as MW3D, an AI would not merely describe the process of “painting” data onto simulations; it would generate and optimize the necessary code, run fast emulators that approximate full hydrodynamic calculations, and iteratively adjust parameters by comparing synthetic and observed observables across all data domains. Human researchers would still define the physics and interpret the meaning, while the AI would manage the computation—deciding when a full rerun is needed, compressing outputs, and learning which assumptions best reproduce the real Milky Way. Such a partnership would make data-driven modeling not just faster, but more integrated, adaptive, and predictive than ever before.” –ChatGPT-5, 11/12/2025

“On the one hand it sounds wildly ambitious at the level of science fiction. On the other hand, I think it sounds like **2026.**”
–Prof. Doug Finkbeiner, PI’s Harvard colleague currently on sabbatical at Anthropic

Astronomers discover huge gaseous wave holding Milky Way's newest stars

'It's right up in our face' – close proximity of stellar nursery to our solar system stuns scientists

The Guardian US

2020

Ian Sample, The Guardian

THE NEW YORK TIMES, TUESDAY, JANUARY 25, 2022

OUT THERE | DENNIS OVERBYE

Where Our Bubble Ends, Our Understanding Begins

By mapping a region devoid of gas and dust, scientists learn more about star formation.

Above, an illustration of the Local Bubble, which formed in the Milky Way, when supernova explosions drove off all the gas and dust from a 1,000-light-year-wide region.

The team plans to go on and map more bubbles in the Milky Way fluff of champagne. There must be more, Dr. Goodman said, because it would be too much of a coincidence for the sun to be smack in the middle of the only one.

The sun's presence in this one is nonetheless coincidental, Dr. Alves said. Our star wandered into the region only five million years ago — long after most of the action — and will exit about five million years from now.

The motions of the stars are more irregular than commonly portrayed, as they are bumped gravitationally by other stars, clouds and the like, Dr. Alves said.

"The sun is moving at a significantly different velocity than the average of the stars and gas in the solar neighborhood," he noted. This would enable it to catch up and pass — or be passed by — the bubble.

"It was a revelation," Dr. Goodman said, "kooky the sun's path really is combed with a simple circle."

Local Bubble began 14 million years ago with a massive supernova, the first of about 15; massive stars died and blew up. Their blast waves cleared out the region. There are now no stars younger than 14 million years in the bubble, Dr. Goodman said.

The bubble continues to grow at about 4 miles a second. "Still, more supernovae are expected to take place in the near future, like Antares, a red supergiant star near the edge of the bubble that could go any century now," Dr. Alves said. "So the Local Bubble is not 'done.'"

With a score of well-known star-forming regions sitting on the surface of the bubble.

Where Our Bubble Ends, Our Understanding Begins

By mapping a region devoid of gas and dust, scientists learn more about star formation.

WHERE IS THE LAST? For New Year resolutions, astronomers have discovered that the Milky Way galaxy, the home to the Sun, is a bubble of gas and dust. The bubble is roughly 100 light years across and is filled with gas and dust. The bubble is roughly 100 light years across and is filled with gas and dust. The bubble is roughly 100 light years across and is filled with gas and dust.

What is in the Air You Breathe?

Amount of NO₂ (10¹⁴ molecules/cm³)

Select a Date: Thu Dec 05 2024

12/5/2024 11:35 AM

TEMPO NO₂ Data

TEMPO, a collaboration between the Smithsonian and NASA, is the first space-based probe to measure air pollution hourly over North America at neighborhood scales. NO₂ (nitrogen dioxide) is one of the pollutants detected by TEMPO. It is produced by wildfires and the burning of fossil fuels. NO₂ contributes to the formation of harmful ground-level ozone and toxic particulates in the air we breathe.
